2	6th April 2018	Second Issue – Month 2 of Monitoring

Contents

1.0 Introduction

An air quality monitoring survey is being undertaken to determine levels of PM_{10}, $PM_{2.5}$ and PM_1 experienced as works undertaken at two locations at the former NIMR site, Mill Hill, Barnet: Phase 1 Monitoring Location 1, Monitoring Location 1B. The monitoring locations are displayed in Figure 1. The purpose of this report is to revi against criteria determined from appropriate guidance to minimise disruption to nearby sensitive receptors as works.

This report relates to measurements made between 1st February 2018 and 1st April 2018.

2.0 Policy and Legislative Context

2.1 Documents Consulted

The following documents were consulted during the undertaking of this assessment:

Legislation and Best Practice Guidance

- The Air Quality Standards (Amendment) Regulations 2016;

- The Air Quality Strategy for England, Scotland, Wales and Northern Ireland, 2007;

- The Environment Act, 1995;

- Local Air Quality Management Technical Guidance LAQM.TG(16), DEFRA, 2016;

- Guidance on Air Quality Monitoring in the Vicinity of Demolition and Construction Sites, IAQM, 2012.

2.2 Air Quality Legislative Framework

European Legislation

European air quality legislation is consolidated under Directive 2008/50/EC, which came into force on 11th Ju Directive consolidates previous legislation which was designed to deal with specific pollutants in a consistent mann new air quality objectives for fine particulates, and includes:

- **Directive 1999/30/EC** – the First Air Quality "Daughter" Directive – sets ambient air limit values for r and oxides of nitrogen, sulphur dioxide, lead and particulate matter;

- **Directive 2000/69/EC** – the Second Air Quality "Daughter" Directive – sets ambient air limit values fo carbon monoxide; and,

- **Directive 2002/3/EC** – the Third Air Quality "Daughter" Directive – seeks to establish long-term ob values, an alert threshold and an information threshold for concentrations of ozone in ambient air.

The fourth daughter Directive was not included within the consolidation and is described as:

- **Directive 2004/107/EC** – sets health-based limits on polycyclic aromatic hydrocarbons, cadmium, arse mercury, for which there is a requirement to reduce exposure to as low as reasonably achievable.

UK Legislation

The Air Quality Standards (Amendments) Regulations 2016 seek to simplify air quality regulation and provide a ne of the Air Quality Framework Directive, First, Second and Third Daughter Directives and also transpose the F Directive within the UK. The Air Quality Limit Values are transposed into the updated Regulations as Air Quality S attainment dates in line with the European Directives. SI 2010 No. 1001, Part 7 Regulation 31 extends powers,

85(5) of the Environment Act (1995), for the Secretary of State to give directions to Local Authorities (LAs) for the of these Directives.

The UK Air Quality Strategy is the method for implementation of the air quality limit values in England, Scotla Northern Ireland and provides a framework for improving air quality and protecting human health from the effects c

For each nominated pollutant, the Air Quality Strategy sets clear, measurable, outdoor air quality standards and which these must be achieved; the combined standard and target date is referred to as the Air Quality Objective pollutant. Adopted national standards are based on the recommendations of the Expert Panel on Air Quality Star and have been translated into a set of Statutory Objectives within the Air Quality (England) Regulations (200 subsequent amendments.

The AQOs for pollutants included within the Air Quality Strategy and assessed as part of the scope of this report a Table 2.1 along with European Commission (EC) Directive Limits and World Health Organisation (WHO) Guidelines.

Table 2.1   Air Quality Standards, Objectives, Limit and Target Values

Pollutant	Applies	Objective	Concentration Measured as[10]	Date to be achieved and maintained thereafter	European Obligations	Date to be achieved ar maintaine thereafter
PM$_{10}$	UK	50µg/m^3 by end of 2004 (max 35 exceedances a year)	24-hour mean	1st January 2005	50µg/m^3 by end of 2004 (max 35 exceedances a year)	1st January 2(
	UK	40µg/m^3 by end of 2004	Annual mean	1st January 2005	40µg/m^3	1st January 2(
PM$_{2.5}$	UK	25µg/m3	Annual Mean	31st December 2010	25µg/m3	1st January 2(

There are currently no UK or EU objectives for PM$_1$.

3.0 Assessment Criteria

3.1 Background Concentrations

Background concentrations as used within the prediction calculations were referenced from the UK National Air Qua
Archive database based on the National Grid Co-ordinates of 1 x 1 km grid squares nearest to the development sit
2017, DEFRA issued revised 2015 based background maps for PM_{10} and $PM_{2.5}$ which incorporate updates to the inpt
modelling. 2018 background maps have been utilised to assess the significance of monitored levels. The up
background concentrations used in the assessment are summarised in Table 3.1.

Table 3.1   Published Background Air Quality Levels ($\mu g/m^3$)

UK NGR(m)		2018	
X	Y	PM_{10}	P
522500	192500	14.4	
523500	192500	14.3	
522500	193500	14.1	
523500	193500	13.9	

London Air's annual mean pollution map uses a detailed model to show a prediction of PM_{10} and $PM_{2.5}$ annual aver
whole of Greater London. The latest accurate model is available for the year of 2013. The detailed annual mean pol
displayed in Figures 3.1 and Figure 3.2.

**Figure 3.1   Modelled Annual Mean PM$_{10}$ Air Pollution (based on measurements made during 2013)**

Figure 3.2   Modelled Annual Mean PM$_{2.5}$ Air Pollution (based on measurements made during 2013)

3.2   Pollutant Sources

The main emissions during demolition are likely to be dust and particulate matter generated during earth (particularly during dry months) or from demolition materials. The main potential effects of dust and particulate are:

- Visual - dust plume, reduced visibility, coating and soiling of surfaces leading to annoyance, loss of amen need to clean surfaces;
- Physical and/or chemical contamination and corrosion of artefacts;
- Coating of vegetation and soil contamination; and,
- Health effects due to inhalation e.g. asthma or irritation of the eyes.

A number of other factors such as the amount of precipitation and other meteorological conditions will also influence the amount of particulate matter generated.

Demolition activities can give rise to short-term elevated dust/PM_{10} concentrations in neighbouring areas. This m from vehicle movements, soiling of the public highway, demolition or windblown stockpiles.

3.3   Particulate Matter

The UK Air Quality Standards seek to control the health implications of respirable PM_{10} and $PM_{2.5}$. However, the ma particles released from construction will be greater than this in size.

Demolition works on site have the potential to elevate localised PM_{10} and $PM_{2.5}$ concentrations in the area. On th mitigation measures should still be taken to minimise these emissions as part of good site practice.

Particulate matter is made up of a collection of solid and/or liquids materials of various sizes. The particles are i into the atmosphere by numerous sources with the major sources being created by road transport. Emissions of c also generate high concentrations of particulate matter.

Particulate matter requires monitoring due to the impacts on human health that large amount of exposure can caus

3.4   Criteria

An assessment using the traffic light approach based on sections 5.3.2 and the IAQM document 'Guidance on Air Monitoring in the Vicinity of Demolition and Construction Sites (2012) is considered appropriate and is proposed 3.2 below. Given the proximity (within 7m) of nearby receptors and the possibility for exposure to PM_{10} the f criteria is proposed.

Table 3.2   Traffic Light Criteria

Alert level	Time Period	Maximum Permissible 15 minute (µg/m³)
Red (*at this level all works to cease immediately, investigate cause of exceedance and use alternative methods where appropriate*)	15-minute average	>250
Amber (*continual monitoring and investigation of alternative methods where appropriate*)	Two consecutive 15-minute averages	>80
Green (early warning/*no action required*)	15-minute average	>80

The below criteria have been adopted for PM$_{2.5}$ levels at the boundary of the site.

Table 3.3   PM$_{2.5}$ Level Criteria – Levels at Boundary

Monitoring Levels	Time Period	PM$_{2.5}$ exceedance limits at mon locations
Red (*at this level all works to cease immediately, investigate cause of exceedance and use alternative methods*)	15-minute average	>48µg/m³
Amber (*continual monitoring and investigation of alternative methods where appropriate*)	Two consecutive 15-minute averages	Between 48 µg/m³ and 40 µg
Green (*no action required*)	15-minute average	<38 µg/m³

4.0 Particulate Matter Survey

4.1 Air Quality Monitoring Methodology

Particulate Matter monitoring was undertaken at each of the monitoring locations as identified in Figure 1. Pa
Matter monitoring was undertaken using two AQ Mesh Pods which are small battery operated monitoring devices
devices record levels of PM_{10}, $PM_{2.5}$ and PM_1 constantly in 15 minute intervals.

The monitored results were compared to both urban background and roadside monitored values of PM_{10} ar
monitored by London Air (www.londonair.org.uk). The urban background values were monitored at the Kensi
Chelsea – North Ken (FIDAS) AURN.

Detailed results of exceedances of the 'red' limit are outlined in Appendix A.

4.1.1 Particulate Matter Results

The results of the Particulate Matter Monitoring Survey are presented in the tables below.

Phase 1 Monitoring Location 1A Results

Table 4.1 Monitoring Results 24 hour averages

Date	PM_{10} (µg/m³)	$PM_{2.5}$ (µg/m³)	PM_1 (µg/m³

5.0 Discussion and Summary

The monitoring results for the second month at the former NIMR site, Mill Hill, Barnet Phase 1 Monitoring Locatic exceedances of the 'red' criteria. 25 of these 'red' exceedances are monitored outside of working hours and are result of site operations. A review of site activities at this time period and location will be conducted.

The monitoring results for the second month at the former NIMR site, Mill Hill, Barnet Phase 1 Monitoring Location 'red' exceedances on the 20th March 2018 monitored within working hours for two 15-minute intervals. A review of this time period and location will be conducted.

On the 3rd March 2018, 'red' and 'amber' exceedances monitored at Location 1A during the course of the day background concentrations. Following a review of weather conditions, these exceedances are likely due to the sn foggy weather conditions affecting the laser during this period.
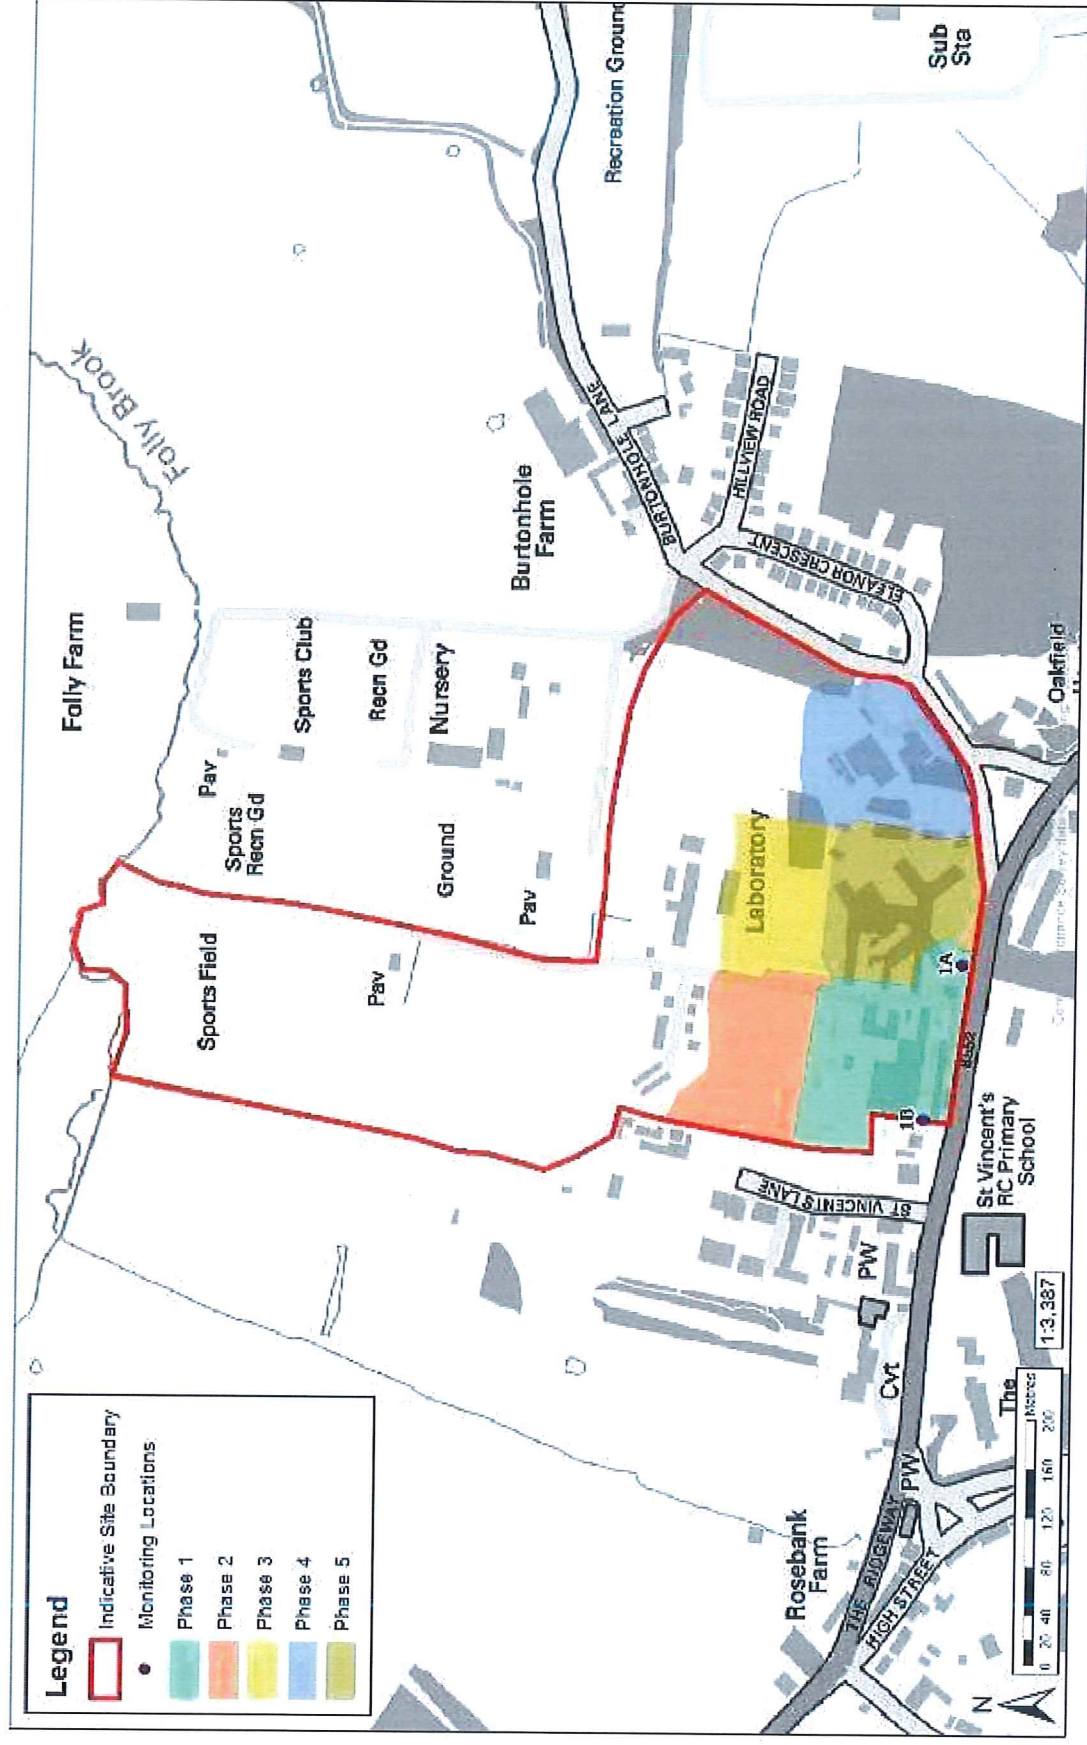

To ensure the effects from the demolition are monitored sufficiently we will continue to monitor the levels of PM_{10} the AQ Mesh monitors. This will be cross checked with the demolition schedule to identify whether the work contributing factor.

WYG will continue to monitor and will make the client aware of any further exceedances and the activities w undertaken which result in exceedances of the 'red' limit will be reported and reviewed. Additionally, an alert syste up which sends e-mail notifications when the 'amber' criteria is triggered which is sent to both WYG and on site ope

Red Limit Exceedances

An assessment using the traffic light approach based on sections 5.3.2 and the IAQM document 'Guidance Monitoring in the Vicinity of Demolition and Construction Sites (2012) was conducted for the site. The in detail r date, time and recorded PM$_{10}$ levels over 250 are outlined in Table A1 and A2. These are regarded as "red" level.
